# Quick update

# Quick update — planned changes

Notes for small product changes. We discuss first. We do not build until we agree.

---

## Cleaning agencies — new actor

**Status:** implemented (product + data-shape from Agreed below).
**Decision canvases:** `cleaning-agency-decisions.canvas.tsx`, `database-shape-decisions.canvas.tsx` (answers captured; source of truth is **Agreed** here).

**Migrate existing DB once:** from `server/`, run `node scripts/migrate-data-shape.js` (offers/history + business memberships).

### Stated goals (from product discussion)

1. New role: `cleaning_agency`.
2. Agencies receive **cleaning-request notifications** for jobs in range (business and personal client posts).
3. An agency has **individual staff members** (role separate from independent cleaners).
4. An agency can **accept a job, then assign staff** (crew allowed); company picks among interested agencies.
5. The agency **sets the staff pay rate** when assigning (record-only vs company payment).
6. **Independent cleaners stay as today**; agency is an extra path alongside them.

### What the product does today (code facts — gaps)

There is **no** agency actor yet. Today's hub only knows:

| Area | Today | Gap for agencies |
|---|---|---|
| Roles | `client`, `business`, `cleaner`, `admin` on `User` | No `cleaning_agency` / `agency_staff` in the role enum, auth register rules, or UI role gates |
| Org / staff | `Business` has `memberIds` for company posters | No `cleaning_agencies` / `agency_memberships` yet |
| Matching | Nearby **available cleaners** only (`role: 'cleaner'` + location) | Agencies are never notified or offered jobs |

| Area | Today | Gap for agencies |
|---|---|---|
| Offers | Each offer is tied to a `cleanerId` | No offer / claim for an agency; no "agency accepted, staff TBD" state |
| Assignment | First cleaner **accept** wins → `assignedCleanerId` | No company-picks-agency path; no crew / reassign / staff confirm |
| Progress | Only the assigned cleaner can advance status | Progress must be agency-only for agency bookings |
| Pay | Business sets `payRatePerHour` on post; `BusinessPayment` is company → platform quote | Need staff wage at assign (min wage floor); record-only, no payout change |
| Notifications / push | New nearby offer → cleaner users; push roles = `cleaner` + `business` | Agency first on new job; staff only after assign; cancel → agency + assigned staff |
| UI | `/cleaner`, `/client`, `/admin` | Need `/agency` hub; staff stay on `/cleaner` but assigned-only |
| Admin | Force-assign only to a `cleaner` user | Force-assign to agency (agency then picks staff) |
| Seed / tests | Demo cleaners + clients + admin | No agency fixtures or behaviour coverage |

## Agreed

Locked from the decision canvas (2026-09-25). Build to these rules.

### Scope

1. **Independent cleaners:** Leave working as today; agency is an extra path.
2. **Agency as data:** New `cleaning_agencies` org (like Business: name, HQ place, `createdBy`); staff links live in `agency_memberships` (not `memberIds` on the org).
3. **Staff account role:** New role (e.g. `agency_staff`) separate from independent cleaner.
4. **Who manages the staff list:** Agency owner plus other agency admin users.
5. **How staff join:** Agency creates the staff account (sets email / temp password).
6. **Staff on multiple agencies:** Many agencies allowed.

### Matching

1. **Which posts agencies see:** Business posts and personal client posts.
2. **Who is notified on a new nearby job:** Nearby agencies first; staff only after the agency assigns them.
3. **What "nearby" means for an agency:** Agency HQ or any available staff nearby (either).
4. **Agency "available / live":** Agency is always eligible when in range (no toggle).
5. **Offer row on the request:** Offer to the agency (`agencyId`); staff chosen later.

### Booking

1. **How an agency books a job:** Agency accepts first (locks the job), then picks staff.
2. **First-wins race:** Company reviews interested agencies and picks one (not instant first-wins).

3. **When staff must be named:** Anytime before schedule start (with a reminder).
4. **Reassign after booking:** Yes, anytime before completed.
5. **More than one staff on a job:** Allow a crew (multiple staff).
6. **Staff response to assignment:** Staff must confirm; if they decline, agency must pick someone else.

**Pay**

1. **Two pay rates:** Company still pays their rate; agency only sets what staff sees / earns.
2. **When staff pay rate is set:** Required when assigning staff to the job.
3. **Staff rate floor:** Yes — same minimum wage per hour.
4. **Who money goes to:** Keep company payment as today; staff rate is record-only.

**Visibility & lifecycle**

1. **What the company sees after booking:** Agency name and assigned staff name.
2. **Who updates job progress:** Agency only (staff has no progress controls).
3. **Staff notifications:** Only when assigned to a job (and later cancel / progress as needed).
4. **Cancel recipients:** Agency and assigned staff.

**Product surfaces**

1. **Agency signup:** Like business: magic link + set password + agency profile.
2. **Agency home screen:** New `/agency` hub (offers, staff, assignments, rates).
3. **Staff home screen:** `/cleaner` but only assigned jobs (no open nearby board).
4. **Admin force-assign:** Admin can assign to an agency (agency then picks staff).

## Capability outline (from Agreed)

- Agency signs up like business (magic link → set password → agency profile); role `cleaning_agency`.
- Agency org is `cleaning_agencies` (like Business); memberships are `agency_memberships` (owner|admin|staff, multi-agency); owner/admins create staff accounts (`agency_staff`).
- On a new nearby job (business or personal client), eligible agencies get the offer (`agencyId`); independent cleaners keep today's path; staff are not notified until assigned.
- Nearby = agency HQ **or** any available staff in range; agency has no live/offline toggle.
- Agencies express interest; the **company picks** one agency (not first-wins). Agency accept locks the job; staff (crew allowed) can be named anytime before schedule start; staff must confirm; reassign allowed until completed.
- Company bill rate unchanged; agency sets staff rate at assign (min-wage floor); staff rate is record-only — no payout change in v1.
- Company sees agency name + assigned staff; progress updates are agency-only; cancel notifies agency + assigned staff.
- UI: `/agency` hub; staff use `/cleaner` for assigned jobs only; admin may force-assign to an agency.

## Agreed — data shape

Locked from the decision canvas (2026-09-25). Extract nested request data first, then build agencies on this shape.

**Decision canvas:** `database-shape-decisions.canvas.tsx` (answers captured; source of truth is **Agreed — data shape** here).

### Rules

1. **When nesting is allowed:** Prefer separate collections + ids by default; embed only tiny fixed fields.
2. **Offers (cleaner + agency):** New `request_offers` collection (one doc per notified cleaner or agency).
3. **Status history:** New `request_events` (or `status_events`) collection; request keeps **current status only**.
4. **What stays on `CleaningRequest`:** Job details + current status + pointers (`assignedAgencyId`, primary staff ids) only.
5. **Agency org record:** New `cleaning_agencies` collection (name, HQ place, `createdBy`) — mirror Business.
6. **Staff membership (many agencies):** New `agency_memberships` (`agencyId`, `userId`, `memberRole`: owner|admin|staff).
7. **Business membership (same treatment as agencies):** New `business_memberships` (`businessId`, `userId`, `memberRole`: owner|admin|…); migrate off embedded `Business.memberIds`. Same join-table pattern as agencies — not a flat id array on the org doc.
8. **Company picks interested agencies:** New `agency_job_interests` (`requestId`, `agencyId`, status, timestamps).
9. **Crew assignment + confirm/decline:** New `job_assignments` (`requestId`, `agencyId`, `staffUserId`, `confirmStatus`, `assignedAt`…).
10. **Staff pay rate (record-only):** New `staff_job_pays` collection (mirrors `business_payments` pattern).
11. **Existing embedded offers / history:** Extract first (migrate + switch code), then build agency on the new shape.
12. **Notifications:** Out of scope for this data-shape work. Do not treat inbox rows as the request↔cleaner join; do not redesign notification collections as part of this pass.

### Build order

1. Migrate `offers[]` → `request_offers` and `statusHistory[]` → `request_events`; switch readers/writers.
2. Migrate `Business.memberIds` → `business_memberships`; switch membership checks / signup writers.
3. Add agency collections (`cleaning_agencies`, `agency_memberships`, `agency_job_interests`, `job_assignments`, `staff_job_pays`).
4. Keep `CleaningRequest` slim: job details, current status, assignment pointers only.
5. Leave notification collections as they are for now.

## Surfaces checklist (implemented)

Built to match Agreed + Agreed — data shape:

- **Auth / roles:** `User.role` enum (`cleaning_agency`, `agency_staff`); `/api/auth/register` allow-list; agency magic-link signup (like business); login redirect / `useRequireRole`.
- **Data model:** Follow **Agreed — data shape** (extract offers/events; migrate business memberships; then agency collections + slim request pointers). Notifications unchanged in this pass.
- **Matching:** nearby = HQ or available staff; always-on agencies; independents unchanged; staff not in new-offer blast.
- **Booking APIs:** agency interest → company pick → accept lock → assign staff (+ rate) → staff confirm / decline → reassign; crew; reminder before schedule start; progress permissions (agency only); cancel recipients.
- **Pay:** company quote unchanged; store staff rate at assign with min-wage floor; no payout / Stripe change in v1.
- **Notifications:** agency on `new_offer`; staff on assign (+ cancel / progress as needed); push registration for agency roles.
- **Client UI:** `/agency` hub (offers, staff, assign, rates); company view (agency + staff names); staff `/cleaner` assigned-only (no open board).
- **Admin:** see agency + staff on a request; force-assign to agency.
- **Docs:** later update `progressive-update.md` core users / journeys once built.
- **Tests / seed:** agency happy path + company-pick + staff decline/reassign + forbidden cases.
